

Setty Dhanamjayulu

RPA UiPath Developer

Mobile: +91 8639421668

E-Mail: ghanamjayuluSetty2@gmail.com

Certified

Professional Summary

Accomplished Senior RPA Developer with 6.3+ years of hands-on experience in designing, developing, deploying, and supporting enterprise-grade automation solutions using UiPath and .Net. Advanced proficiency in UiPath, REFramework, Orchestrator, API integration, Intelligent Document Processing (IDP), and automation architecture, with basic knowledge of Power Automate. Experienced in developing intelligent automation solutions using Agentic AI, AI Agents, UiPath Maestro, LLMs, Document Understanding, Integration Service, REST APIs, and human-in-the-loop workflows. Proven ability to translate complex business requirements into scalable, secure, and reusable automation solutions while collaborating with cross-functional Agile teams.

Key Responsibilities

- Lead end-to-end RPA lifecycle including requirement analysis, PDD/SDD, solution design, development, testing, deployment, and production support.
- Design and deploy scalable UiPath automation solutions using REFramework, reusable components, libraries, and enterprise best practices.
- Configure and manage UiPath Orchestrator, including queues, assets, triggers, robots, roles, environments, monitoring, and scheduling.
- Design Agentic AI and intelligent automation solutions using UiPath, AI Agents, and UiPath Maestro to orchestrate complex end-to-end business processes.
- Build agentic workflows coordinating AI Agents, UiPath Robots, APIs, applications, and human-in-the-loop activities for enterprise automation.
- Integrate LLMs, Document Understanding, Intelligent Document Processing (IDP), Integration Service, REST/SOAP APIs, databases, SAP, web, and Citrix applications.
- Develop context-aware and AI-powered workflows with intelligent decision-making, document processing, validation, and human oversight.
- Implement robust exception handling, retry/recovery mechanisms, logging, monitoring, and fallback strategies to ensure automation reliability.
- Design enterprise-grade automation architecture with modular components, API-driven integrations, centralized configuration, governance, security, and scalability.
- Monitor production bots, queues, schedules, and application dependencies to maintain high availability and SLA compliance.
- Provide L2/L3 production support, including incident resolution, troubleshooting, root cause analysis, defect fixing, and permanent corrective actions.
- Support UAT, deployment validation, release management, hypercare, and post-production stabilization activities.
- Ensure secure credential management, access control, compliance, and enterprise security standards across automation solutions.
- Participate in code reviews, CI/CD, version control, coding standards, and automation governance practices.
- Prepare and maintain PDDs, SDDs, technical documentation, architecture documents, and knowledge-transfer materials.
- Train and mentor junior developers and continuously identify opportunities to improve automation reliability, scalability, maintainability, and business value.

Skills

Category	Skills
Languages	.Net, Python (AI ML), VBA, Macro, Automation Anywhere, Power Automate.
Scripting	Python Script, VBA (Macro), VB Script
Development Tools	RPA UiPath, Automation Anywhere, Power Automate
Database	Oracle SQL, PostgreSQL
Operating System	Windows 10, Windows 11
Version Control	GitHub, Bitbucket

Academic Records

- B. TECH (MECH ENGINEERING), SRI VENKATESWARA COLLEGE OF ENGINEERING, 2016 – 2019.
- DIPLOMA (MECH), GOVERNMENT POLYTECHNIC, PILLARIPATTU, 2012 - 2015.
- HIGH SCHOOL, VISWA BHARATHI ENGLISH HIGH SCHOOL, 2012.

Experience

- I AM WORKING AS A SENIOR SOFTWARE ENGINEER AT COFORGE TECHNOLOGIES FROM SEPTEMBER 2024 AND TILL NOW.
- I WORKED AS A SENIOR SOFTWARE ENGINEER AT WIPRO TECHNOLOGIES FROM JUNE 2022 TO JULY 2024.
- I WORKED AS A SOFTWARE ENGINEER AT VIRTUSA CONSULTING SERVICES PVT LTD. (PAYROLL) FROM JUNE 2020 TO MAY 2022.

Projects

PROJECT: 01

Project: Intelligent Invoice Processing Automation
Role: Senior RPA Developer

Project Description:

Worked on an end-to-end intelligent invoice processing automation combining Document Understanding, agentic orchestration, and human-in-the-loop validation to process scanned customer invoices with minimal manual intervention. Customer invoices received via email are stored in SharePoint and processed through a Document Understanding pipeline built in AI Center, using a trained ML-based extractor to pull key invoice fields — invoice number, date, amount, vendor name, and related details. Rather than running extraction as an isolated linear workflow, the end-to-end process is orchestrated in Maestro, combining an extraction agent, a robot that logs into SAP to update invoice records, and a human-in-the-loop approval step into a single coordinated process. Implemented field-level confidence validation instead of relying on a single overall confidence score, ensuring that a high overall score cannot mask an error in a critical field such as invoice number or amount. Configured Action Center (Action Catalog) to route any invoice with a low-confidence critical field to a human reviewer before the SAP update proceeds. Built an agentic decision layer within Maestro so the agent evaluates extracted data and confidence scores at runtime and dynamically decides whether to proceed automatically, route for human review, or flag an exception, rather than following a fixed, hardcoded path.

Target Applications: UiPath Document Understanding, AI Center, Maestro, Action Center, SAP, SharePoint

Bot Frequency: Event-based (triggered on invoice receipt) + Real-time agent-driven decisioning within Maestro

Responsibilities:

- Collaborated with finance and business stakeholders for requirement gathering; prepared taxonomy definitions and extraction field specifications for the Document Understanding pipeline.
- Designed and built the Document Understanding solution in AI Center, including taxonomy creation, sample document labeling, ML-based extractor training, model evaluation, and publishing.
- Architected the end-to-end orchestration in Maestro, combining the extraction agent, SAP update robot, and human-in-the-loop approval step into a single coordinated process rather than disconnected automations.
- Implemented field-level confidence validation logic, applying business-defined thresholds to critical fields (invoice number, date, amount) rather than relying solely on the overall document confidence score.
- Configured Action Center (Action Catalog) workflows to route low-confidence critical fields to human reviewers for validation prior to downstream SAP updates.
- Built an agentic decision layer within Maestro enabling the agent to dynamically evaluate extraction results and confidence scores, and determine whether to proceed automatically, request human review, or flag an exception.
- Integrated SharePoint for invoice storage and retrieval, and SAP for downstream data updates following successful validation.
- Performed error handling and exception routing for low-confidence extractions, ensuring critical-field errors are never silently auto-approved.
- Conducted testing and validation with business stakeholders to confirm extraction accuracy and confidence thresholds before deployment.
- Continued exploring agent configuration for passing supporting/reference documents to the extraction agent for context-aware classification (e.g., distinguishing finance vs. HR invoices), as part of ongoing enhancement of the agentic layer.

PROJECT: 02

Project: Active Directory Lifecycle Management – Joiner & Leaver Automation

Role: Senior RPA Developer

Project Description:

Worked on an end-to-end AD Creation and Deactivation Automation solution to streamline employee onboarding and offboarding processes. Integrated with Darwin box APIs to fetch HR clearance status and automatically trigger ITSM tickets for new joiners to create Windows credentials. Stored and tracked all ticket and employee details in a centralized data warehouse. Developed a scheduler-based process that runs hourly to assign tickets to appropriate queues based on workgroups and route them to respective automation workflows. Automated Active Directory account creation in on-premise systems, including user credential setup, group assignment, and policy allocation through AD cloud automation. Enabled application access provisioning through user management tickets and maintained status in a user data table.

For offboarding, detected inactive status from Darwin box, initiated ITSM tickets, and automated user deactivation in both on-premise and cloud AD, along with revoking application access. Additionally, coordinated with the IT team for asset allocation and recovery, ensuring a complete and compliant employee lifecycle management process.

Target Applications: Active Directory (On-Premise & Cloud), Darwin Box, ITSM Ticketing System, SQL Data Warehouse, Azure AD

Bot Frequency: Real-time (on manager/HR approval trigger) + Hourly (queue assignment and ticket processing)

Responsibilities:

- Collaborated with HR, IT, and Compliance stakeholders for comprehensive requirement gathering; prepared Process Design Document (PDD) and Solution Design Document (SDD) with workflow architecture diagrams.
- Designed and architected end-to-end UiPath workflows for joiner and exit employee processes with multi-stage orchestration and conditional routing logic.
- Implemented Darwin Box API integration using OAuth 2.0 authentication to fetch and validate employee clearance status in real-time.
- Developed ITSM ticket creation and assignment automation with hourly scheduler process routing tickets to workgroup-based queues.
- Engineered on-premise Active Directory credential creation with automated group and policy allocation logic using cloud-based AD management tools.
- Implemented comprehensive error handling, retry logic (using Postpone Transaction Item architecture), and fallback mechanisms for API and AD operations.
- Performed complex data transformation and synchronization operations, mapping HR/ITSM data to enterprise data warehouse using LINQ and SQL operations.
- Designed and deployed queue-based architecture for scalable ticket processing with parallel execution capabilities.
- Conducted UAT with business stakeholders and IT teams; provided post-production support and maintained SLAs for onboarding and separation timelines.
- Documented GxP-compliant functional specifications, audit trails, and security controls for pharmaceutical regulatory compliance.
- Trained and mentored junior developers on AD integration patterns, API authentication, and compliance requirements.

PROJECT: 3

Project: Biometric Access Control Integration Process

Role: Senior Software Engineer

Project Description: In this multi-application integration project, we designed and implemented an RPA-based solution to integrate the Biometric Access Control System (Spectra iApp database) with Compliance Wire (CW) and TrackWise applications (TW). The process ensures that only employees who have completed mandatory SOP training are granted facility access. UiPath bots are developed to extract and reconcile employee training data, validate compliance status, automatically block or unblock biometric access, and trigger email notifications to stakeholders such as QA, Training, IT, and Security teams. The solution ensures secure, compliant, and automated access control with real-time monitoring.

Target Applications: Database Integration (Spectra iApp, Compliance Wire, TrackWise)

Bot Frequency: Block (Every day) and Unblock (Every Half-an-Hour)

Responsibilities:

- Interacted with Client for requirement gathering and prepared documents like Process Design Document (PDD) and Solution Design Document (SDD).
- Helped and trained Analysts in designing the complete workflow of process to be automated.
- Design and architect UiPath workflows based on the identified processes. Develop a comprehensive understanding of the automation scope.
- Implement automation logic, decision-making, and error handling end to end implementation for processes simultaneously.
- Perform data manipulation and transformation within UiPath workflows. Handle data validation and ensure data accuracy.
- Deploy UiPath automations in production environments. Provide ongoing support and maintenance for deployed automations.

PROJECT: 4

Project: User Management Automation (Standalone & Server-Based Applications)

Role: Senior Software Engineer

Project Description: In this user management automation project, developed an RPA-based solution to handle user provisioning, role modification, and deactivation for both standalone and server-based applications. When an employee requires access, an ITSM ticket is raised and assigned to the respective workgroup. The UiPath bot retrieves ticket details via API, fetches user information from Active Directory (AD), and creates user accounts in target applications based on predefined access rules. For Exit employees, the bot modifies roles or disables access as per the ITSM request. The process follows a queue-based mechanism to efficiently handle multiple requests, ensure timely execution, and maintain process accuracy. Any business exceptions are routed to the respective application SPOC, and tickets are resolved automatically upon successful completion.

Target Applications: Server-Based Applications / Active Directory / ITSM Tools

Bot Frequency: Queue-Based

Responsibilities:

- Interacted with clients for requirement gathering and prepared documents like Process Design Document (PDD) and Solution Design Document (SDD).
- Designed and developed UiPath workflows for automated user creation, role modification, and deactivation across multiple applications.
- Integrated ITSM APIs to fetch ticket details and process requests dynamically.
- Retrieved and validated user data from Active Directory (AD) for accurate account provisioning.
- Implemented queue-based architecture to manage high-volume ticket processing efficiently.
- Developed business logic to handle onboarding (user creation) and offboarding (access removal/disablement) scenarios.
- Implemented exception handling to route failed or business exception cases to respective application SPOCs.
- Ensured timely ticket resolution and maintained audit logs for all transactions.
- Deployed bots in production and provided continuous monitoring, support, and

enhancements.

PROJECT: 5

Project: Integration Monitoring process

Role: Senior Software Engineer

Project Description: In multi-client integration monitoring project, we customize our process to efficiently download integration files from Workday through navigation path. Pay group data is seamlessly fetched from User Excel or Workday and downloading workday deduction file, and using VBA code (Macro), we meticulously manipulate the data to meet your specific requirements. The outcome is a simplified and client-specific dataset, offering you precisely refined Workday files for effective decision-making.

Target Applications: Web Automation

Bot Frequency: Every Day

Responsibilities:

- Interacted with Client for requirement gathering and prepared documents like Process Design Document (PDD) and Solution Design Document (SDD).
- Helped and trained Analysts in designing the complete workflow of process to be automated.
- Design and architect UiPath workflows based on the identified processes. Develop a comprehensive understanding of the automation scope.
- Implement automation logic, decision-making, and error handling end to end implementation for processes simultaneously.
- Perform data manipulation and transformation within UiPath workflows. Handle data validation and ensure data accuracy.
- Deploy UiPath automations in production environments. Provide ongoing support and maintenance for deployed automations.

PROJECT: 6

Project: Mass load process

Role: Senior Software Engineer

Project Description: The process is all about loading a high volume of data from a spreadsheet loader template to oracle HCM a web portal. Input data to load will be provided by the user & validation of data will be performed while loading it. Bot login to respective spreadsheet loader template and then copy input data in it. After performing validation, Bot loads the input data into the oracle HCM web portal.

Target Applications: Excel Template, outlook exchange mail server.

Bot Frequency: Every Thursday and Friday.

Responsibilities:

- Collaborated with clients for precise requirement gathering, leading to the

creation of detailed PDDs and SDDs.

- Trained and guided analysts, enabling them to design effective and efficient automation workflows.
- Architected and implemented UiPath workflows, mastering the scope and ensuring alignment with project goals.
- Developed comprehensive automation logic, successfully managing decision-making and error handling across multiple processes.
- Conducted thorough data manipulation and validation within UiPath workflows, ensuring accurate and consistent results.
- Deployed and supported UiPath automations in live environments, ensuring ongoing reliability and maintenance.

Declaration

Managed and communicated effectively with the team. I confidently affirm that the information provided is accurate to the best of my knowledge, and I am committed to contributing my full cooperation to help achieve the organization's objectives.
